The global Underground Utility Mapping Software market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Underground utility mapping is a survey using geophysical techniques to create a digital representation of what is buried underground. The survey composes a highly detailed below surface profile using the latest technology, including Ground Penetrating Radar (GPR) equipment, and Electro-Magnetic Locators (EML).

There is a global shift towards renewable energy sources and decarbonization efforts. Utility companies are increasingly integrating renewable energy technologies, such as solar, wind, and hydroelectric power, into their energy generation mix. This transition is driven by factors such as government incentives, cost reductions in renewable technologies, and growing concerns about climate change. The utility market is experiencing a trend towards greater renewable energy adoption and a reduction in reliance on fossil fuel-based sources. The development and implementation of smart grid technologies and digitalization are transforming the utility market. Smart grid technologies enable more efficient distribution and management of energy resources, integration of renewable energy sources, and improved grid reliability. Digitalization is also enhancing customer engagement and enabling the adoption of advanced metering infrastructure (AMI), demand response programs, and energy management systems. The use of energy storage systems, such as batteries, is gaining momentum in the utility market. Energy storage enables better integration of intermittent renewable energy sources, improves grid stability, and allows for peak load management. The decreasing costs of energy storage technologies are making them increasingly attractive for utility companies.
