The global Underwater Acoustic Modem market size is predicted to grow from US\$ 70.8 million in 2025 to US\$ 134 million in 2031; it is expected to grow at a CAGR of 11.2% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

A modem is a device that modulates one or more wave signals to encode digital information for transmission. It demodulates signals to decode the transmitted information. The objective is to generate a signal that can be transmitted and decoded easily to reproduce the original data. Modems are used with any means of transmitting analog signals, from RF to microwaves to LEDs.

The increasing adoption of underwater acoustic modems in naval defense to support communication system is one of the primary growth factors for this market. These systems are used in applications such as submarine communications; diver communications; and remote underwater monitoring, command, and control. The focus of the developed countries towards strengthening their naval defense force is estimated to increase the applications of the defense acoustic modems.
