Underwater camera strobes are specialized lighting devices used in underwater photography. They are designed to provide a burst of artificial light to illuminate the subject in the low - light conditions that prevail underwater. These strobes attach to underwater cameras or housings and emit a powerful, short - duration flash of light. They help to enhance color, contrast, and detail by compensating for the absorption and scattering of light that occurs as it travels through water. This allows photographers to capture clear and vibrant images of underwater scenes such as marine life, coral reefs, and submerged structures that would otherwise be dull or poorly lit due to the limited penetration of natural sunlight.

United States market for Underwater Camera Strobes is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
