The report requires updating with new data and is sent in 48 hours after order is placed.

Underwater optical motion capture system is a technical system used to capture and record the movement of objects or organisms in underwater environments. This system uses optical sensors and camera equipment to track and record the movement and posture of underwater objects. Typically, such systems include specially designed underwater cameras, lighting equipment, and computer software to process and analyze the captured data.

Motion capture in an underwater environment requires facing challenges, such as the absorption and scattering of light by water, posture changes of underwater objects, changes in natural light, etc. Therefore, underwater optical motion capture systems need to be specially designed and calibrated to ensure accurate capture of motion data.

This technology is widely used in the fields of underwater motion research, underwater robot control, marine biology research, and underwater film and television production. Through underwater optical motion capture systems, researchers and professionals can obtain motion data of objects or organisms in the underwater environment to analyze, simulate, and improve related research or applications.

The global Underwater Optical Motion Capture System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
