Underwater rescue robot is a kind of robot with rescue function, which can carry out underwater search and rescue. Generally, it can be divided into two types: autonomous and remotely operated. Underwater rescue robots can be equipped with a variety of search and detection sensors, It can move freely in the water through the remote control of the intelligent control platform and search for data in real time. After determining the target, it can carry out underwater search and rescue by carrying fishing and rescue robots and return to the search ship. The underwater rescue robot uses a high torque synchronous drive device, which is equipped with a microprocessor-controlled three-stage venous power management system and a submersible jet motor. It adheres to being made only with high-quality parts and special high-grade coatings, so it is extremely durable and does not need maintenance. After the endurance test of 10000

hours of full load operation, there is no problem of failure performance degradation.
