## Abstracts

The global Underwater Transceiver market size is predicted to grow from US\$ 538 million in 2025 to US\$ 764 million in 2032; it is expected to grow at a CAGR of 5.2% from 2026 to 2032.

An underwater transceiver is a specialized electronic device used underwater, integrating signal transmission and reception functions. Its core function is to convert electrical signals into sound waves (for transmission) using an underwater acoustic transducer, and then convert the received sound waves back into electrical signals (for reception), thereby enabling wireless digital communication between underwater nodes. It overcomes the physical limitation of radio waves' inability to propagate over long distances in water, making it a key enabling component for modern underwater observation networks, collaborative underwater unmanned vehicles, and seabed engineering. The upstream supply chain mainly includes raw materials and core components (such as pressure-resistant alloys, acoustic ceramics, watertight connectors, and signal processing chips); downstream applications widely cover marine engineering, submarine communication, and marine scientific research, ultimately integrating into various underwater unmanned systems and observation networks. In 2025, the production of underwater transceivers is estimated at approximately 110,000 units, with an average price of approximately US\$5,000 per unit, a gross profit margin of approximately 50%, and a single-line capacity of 1,500 units per year.

United States market for Underwater Transceiver is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Underwater Transceiver is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
