Universal transfer pumps are also called lobe pumps, etc., and rotor pumps are positive displacement pumps. It achieves the purpose of transporting fluid by means of the periodic conversion of multiple fixed-volume transport units in the working chamber. The mechanical energy of the prime mover is directly converted into the pressure energy of the conveying fluid by the pump. The flow rate of the pump depends only on the volume change value of the working chamber and its change frequency per unit time, and (theoretically) has nothing to do with the discharge pressure; the rotor pump is working In the process, a pair of synchronously rotating rotors is actually used to achieve the purpose of conveying materials.
