The global Unmanned Delivery Vehicle Wire-controlled Chassis market size is predicted to grow from US$ 863 million in 2025 to US$ 2335 million in 2031; it is expected to grow at a CAGR of 18.1% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

The Unmanned Delivery Vehicle Wire-controlled Chassis serves as the crucial technical foundation for unmanned delivery vehicles to achieve autonomous operation. It replaces the traditional mechanical connections with electronic signals to precisely control the vehicle's core systems such as steering, braking, and driving. This wire-controlled chassis mainly consists of three subsystems: steer-by-wire, brake-by-wire, and drive-by-wire. During operation, various sensors collect real-time information about the vehicle's driving status and surrounding environment, and convert this information into electronic signals that are transmitted to the electronic control unit. The electronic control unit analyzes and processes these electronic signals according to preset algorithms and then sends precise instructions to the corresponding actuators to complete operations such as steering, braking, and acceleration of the vehicle. For instance, when steering is required, the steer-by-wire system converts the steering intention of the driver (in the unmanned delivery scenario, it is actually the autonomous driving system) into electronic signals, which then drive the steering motor to realize wheel steering. When braking is needed, the brake-by-wire system quickly responds to the braking signal and directly builds braking pressure through an electronic booster to ensure smooth braking of the vehicle. This wire-controlled chassis design offers advantages such as fast response speed, high control precision, and a simple structure. It can adapt to the
