The global Unsecured Prestressed Steel Strand market size is predicted to grow from US\$ 411 million in 2025 to US\$ 526 million in 2032; it is expected to grow at a CAGR of 3.7% from 2026 to 2032.

Unsecured prestressed steel strand is one type of steel strand and an important material used in prestressed concrete structures. It is widely used in fields such as construction, bridges, tunnels, water conservancy engineering, and foundation engineering, which can effectively improve the bearing capacity, seismic resistance, crack resistance, and durability of concrete structures. Unsecured prestressed steel strand are mainly used in post tensioned prestressing systems. Due to the presence of a plastic sheath and grease on their outer surface, they do not bond with the surrounding concrete. During their operation, the prestressing tendons are allowed to slide longitudinally relative to the surrounding concrete, and the prestressing force is completely transmitted to the concrete through the anchorage. During the construction process, unsecured prestressed steel strand can be directly laid into the formwork, and then concrete can be poured. After the concrete reaches the design strength requirements, it can be tensioned and anchored without the need for reserved holes or grouting processes. Due to the special design and construction technology of non bonded steel strands, they can quickly and efficiently complete prestressing and tensioning work during the construction process, improving construction efficiency. In addition, the presence of plastic sheaths and grease can also have a significant anti-corrosion effect, making it a significant advantage in the field of engineering construction.
