The global Unshielded Power Inductor market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

An Unshielded Power Inductor is a passive electronic component that stores energy in a magnetic field when electrical current flows through it. Unlike shielded inductors, which have a magnetic shield to contain and direct the magnetic field, unshielded inductors do not have such a shield. This lack of shielding means that the magnetic field can spread beyond the inductor, potentially leading to interference with nearby components.
