Unshielded proximity sensors are also known as unshielded proximity switches or unshielded proximity sensors. It is a sensor that detects the approach or departure of an object, and it does not use an external shield to limit the sensing range compared to shielded proximity sensors. How it works: An unshielded proximity sensor changes the signal returned by its sensor element according to the approach or distance of an object. Depending on the sensor type, these signals can be changes in capacitance,

changes in inductance, light reflections, etc. The sensor receiving circuit analyzes and processes these signals to detect the presence or disappearance of the target object.
