Urban Rainwater Sponge City Permeable Pavement System is a pavement structure that allows rainfall to infiltrate, store, filter and slowly discharge through permeable surface layers, bedding layers and drainage structures. It is used to reduce urban runoff, improve groundwater recharge and relieve drainage pressure. Applications include sidewalks, plazas, parking lots, residential communities, parks, roadsides and public infrastructure. The market covers permeable pavement materials and system installation products, but excludes ordinary impermeable pavements, drainage pipes counted separately and general landscape construction services.

The industry chain includes permeable bricks, porous concrete, aggregates, geotextiles, bedding sand, binders, drainage layers, edge restraints and construction equipment. Midstream activities include material production, mix design, system design, paving, compaction, joint filling, permeability testing and maintenance planning. Downstream

demand comes from municipal projects, urban renewal, residential communities, commercial plazas, parks, schools and transportation facilities. Growth is driven by stormwater management, flood prevention, sponge city policies, climate adaptation and low-impact urban development.
