Abstracts

The global Urea Breath Test System market size is predicted to grow from US\$ 1239 million in 2025 to US\$ 1743 million in 2032; it is expected to grow at a CAGR of 5.3% from 2026 to 2032.

In 2025, global Urea Breath Test System production reached approximately 0.352 M Units. The average price is approximately \$3,600. A Urea Breath Test System is a non-invasive diagnostic platform that detects active *Helicobacter pylori* infection by analyzing isotopically labeled carbon dioxide in a patient's breath following ingestion of labeled urea.

Gross Profit Margin Levels

The profit structure of urea breath test systems (UBT) exhibits a typical dual-engine model of 'equipment deployment + consumable repurchase,' with core profits primarily derived from reagents and disposable consumables. Under the C-UBT system, consumables such as labeled urea, test meals, and exhalation bags/tubes have strong compliance and channel barriers. Furthermore, the testing has a rigid demand for 'retesting after treatment,' resulting in high repurchase rates and stable cash flow. The gross profit margin for consumables typically reaches 60%-75%. Analytical equipment (such as NDIR, MCS, or liquid scintillation counters) involves optical modules, sensors, and overall manufacturing costs, resulting in a gross profit margin generally in the 30%-50% range. However, once the equipment is installed, it can continuously drive consumable sales, significantly increasing customer lifetime value (LTV). Based on a comprehensive calculation encompassing 'equipment + reagents + services,' the industry's overall gross profit margin typically remains around 50%-65%. If a company possesses large-scale distribution channels, self-produced isotope substrates, or a

regional monopoly advantage, the gross profit margin can extend further upwards.

Industry Drivers

The core drivers of UBT industry growth come from three main factors: the widespread adoption of non-invasive testing, the high prevalence of *Helicobacter pylori*, and the strengthening of standardized diagnostic and treatment processes. Firstly, UBT directly reflects active infection and is widely used in clinical pathways for initial diagnosis and confirmatory retesting after eradication therapy, demonstrating clear and rigid application scenarios. Secondly, the infection rate of *H. pylori* remains high in some Asia-Pacific, European, and emerging markets, driving stable growth in demand for health check-ups and outpatient testing. Thirdly, the increased portability and automation of outpatient POCT equipment have extended UBT from specialized gastroenterology departments to health check-up centers, primary healthcare institutions, and chain clinics, significantly expanding testing coverage. Simultaneously, inclusion in medical insurance, the expansion of chain medical institutions, and the formation of a closed-loop management model of 'testing-treatment-retesting' also enhance the certainty of continuous consumption of consumables. From a technical perspective, the improved multi-channel high-throughput equipment, digital reporting system, and LIS/HIS integration capabilities make UBT's efficiency advantages in large-scale operations more apparent, thereby further consolidating its mainstream position in the field of *Helicobacter pylori* detection.
