Urea cycle disorders are a group of metabolic diseases in which the levels of circulating ammonia or glutamine are elevated due to functional loss or abnormality of enzymes or transporters involved in the urea cycle. Symptoms of this disease may appear at any age, and the earlier the symptoms appear, the more severe the disease. UCD patients may experience hyperammonemia crisis, which is when the ammonia level in the blood is too high, which may cause irreversible brain damage, coma or death. In addition to hyperammonemia crisis, UCD patients may also experience other symptoms such as vomiting, food refusal, irritability, low muscle tone, and delayed motor and intellectual development. The probability of this group of metabolic diseases occurring in newborns is 1/35,000.
