## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Urethane-lined rollers are rollers covered with a thick layer of urethane.

Lining is a surface treatment in which the surface is covered with a material such as resin. Urethane-lined rollers use urethane rubber to line the metal inside the rollers, preventing metal-to-metal contact in conveyor systems and preventing wear and tear on the roller fittings.

Urethane is resistant to abrasion caused by friction. Therefore, urethane-lined rollers can be expected to function effectively over a long period of time and have a long service life. In addition, urethane's elasticity and moderate flexibility allow it to absorb shock and protect the goods being transported.

However, urethane is generally sensitive to low and high temperatures. When used in extreme temperature environments, the performance and life of urethane linings may be affected.

The global Urethane Lined Roller market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
