A urethral sling system is a surgical device used to treat stress urinary incontinence (SUI) in both women and men. Stress urinary incontinence is the involuntary leakage of urine during activities that increase abdominal pressure, such as coughing, sneezing, or exercising. The urethral sling procedure involves placing a supportive mesh or tape under the urethra or bladder neck to provide additional support, helping to prevent leakage. This support mimics the normal anatomical position and function of pelvic structures that may have been weakened due to childbirth, surgery, or aging. The sling can be made from synthetic materials or harvested tissue and is inserted through a minimally invasive procedure. The urethral sling system is effective in restoring continence, offering a long-term solution for patients with stress urinary incontinence.

The global Urethral Sling System market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
