## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

A USB Holter monitor is a medical device used to monitor a patient's heart activity over a period of time. It is a portable device that is worn by the patient and records the electrical signals of the heart. The data is then stored on a USB device, making it easy to transfer and analyze the information. The USB Holter monitor is typically used for diagnosing and monitoring conditions such as arrhythmias, heart palpitations, and other heart-related issues. It allows doctors to analyze the patient's heart activity and identify any abnormalities or irregularities. The device is connected to electrodes that are placed on the patient's chest. These electrodes detect the electrical signals produced by the heart and transmit the data to the USB Holter monitor. The monitor records the data continuously for a specific period of time, usually 24 to 48 hours, although longer monitoring periods are also possible. Once the monitoring period is complete, the USB Holter monitor is disconnected from the patient and the data is transferred to a computer for analysis. The data can be viewed and interpreted by medical professionals to determine the patient's heart health and identify any potential issues. Overall, a USB Holter monitor provides a convenient and efficient way to monitor a patient's heart activity over an extended period of time, allowing for accurate diagnosis and treatment of heart conditions.

The global USB Holter Monitor market size is projected to grow from US\$ million in 2023 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
