Abstracts

The global USB Multiplexer market size is predicted to grow from US$ 2166 million in 2025 to US$ 2943 million in 2032; it is expected to grow at a CAGR of 4.6% from 2026 to 2032.

In 2024, the global production of USB multiplexers was 270 million units, with an average price of US$7.9 per unit.

A USB multiplexer, or switch, allows a single USB device to be shared between two or more computers, or allows a single computer to connect to multiple devices one at a time. It acts like a traffic controller for USB connections, directing the data and power to a selected path, often controlled by a button or software.

The upstream of the USB multiplexer industry chain includes semiconductor chip design and wafer manufacturing, electronic component supply, and circuit board manufacturing. Representative companies include Texas Instruments, Analog Devices, Nexperia, Onsemi, and Renesas. Downstream customers are concentrated in consumer electronics, automotive electronics, and test equipment manufacturers, such as Dell, Lenovo, Tesla, Keysight, and Huawei. These companies extensively use USB multiplexers in motherboard signal distribution, USB-C interface integration, and multi-port communication control.

Downstream demand growth is mainly driven by the evolution of high-speed interface standards and the trend towards device interface integration. With the widespread adoption of USB4, Thunderbolt 4, and Type-C standards, devices have higher requirements for data rates, power supply capabilities, and interface sharing, driving the widespread use of multiplexers in laptops, docking stations, monitors, and smart cars. Automotive electronics is becoming a new growth area, with smart cockpits, in-vehicle information systems, and charging control modules all requiring the integration of high-

speed USB channel switching. In the field of test and automation equipment, the demand for multi-channel signal testing and data acquisition has also promoted the market expansion of high-performance multiplexing chips and modules.

The industry development trend is towards high bandwidth, low loss, and multi-protocol compatibility. USB multiplexers are upgrading from the traditional USB 3.0/3.1 to USB4, supporting speeds up to 40Gbps, while also being compatible with DisplayPort and Thunderbolt signal transmission. Driving factors include the upgrading of high-speed interface technologies, the accelerated pace of automotive electronics and industrial automation, and the increasing demand for miniaturized multi-interface devices. Obstacles include the difficulty of controlling high-frequency signal integrity, the high complexity of chip design, and the supply risks posed by the technological monopoly of major international chip manufacturers. Furthermore, long certification and testing cycles have slowed down the product launch speed for some small and medium-sized manufacturers.

In terms of single-line capacity, a mature USB multiplexer chip packaging line has an annual capacity of approximately 20 million to 30 million units. Gross margin depends on the application type and speed level. The gross margin for low-to-medium speed USB 2.0/3.0 products is approximately 20% to 25%, while the gross margin for high-speed USB4/Thunderbolt compatible products can reach 30% to 40%.
