The user interface (UI) is the outlook designed into an information device with which a user may interact. This can include keyboards, display screens, and the appearance of a desktop. It is also the medium through which a user interacts with a website or an application. There are distinctive software systems and tools to aid the design and implementation of user interface software. Such tools demonstrate substantial productivity gains for programmers and are becoming significant commercial products. User interface software is the foundation upon which the interface is built. The quality of the building blocks offered by the software establishes the framework in which an interface designer works. The tools enable the designer to quickly experiment with different design approaches and are also available to non-programmer designers. Designed user interfaces are efficient, self-explanatory, and user-friendly aids in operating machines to produce desired results. Such interfaces generally have a design with least input to obtain the desired output from the user, and the machine has the minimum amount of undesirable output for the user. The interfaces generated from tools can be presented in any operating system and platform in any preferred language. Moreover, the user can instantly shift to other languages.
