The global UV Absorber HEB market size is predicted to grow from US\$ 95.87 million in 2025 to US\$ 158 million in 2032; it is expected to grow at a CAGR of 8.0% from 2026 to 2032.

UV Absorber HEB (Generic Name: Diethylhexyl Butamido Triazone; CAS: 154702-15-5) is a highly efficient, oil-soluble UVB sunscreen agent belonging to the triazone class. It primarily absorbs ultraviolet radiation within the 280-320 nm range (with a peak absorption at approximately 311 nm). Characterized by excellent photostability, strong absorption capacity, low toxicity, and superior compatibility with oil phases, it is frequently utilized in cosmetic products requiring high Sun Protection Factor (SPF) ratings.

The core raw materials for UV Absorber HEB include cyanuric chloride, ethylhexyl p-aminobenzoate, and specialized amidation reagents. The competitive barrier at this stage of the value chain lies in the precision of the synthesis process—specifically, the control over the yield of the tri-substitution reaction involving the triazine ring, as well as the capability to effectively eliminate heavy metals and trace impurities. Downstream applications for HEB include sunscreens, anti-aging day creams, and high-end color cosmetics. Driven by the growing global awareness regarding skin cancer prevention, downstream brands have demonstrated a sustained increase in demand for HEB, increasingly leveraging it as a key selling point to enhance both product SPF values and overall skin feel.

In 2025, global sales volume is projected to reach approximately 2,200 tons, with pricing ranging between \$43,000 and \$46,000 per ton. The industry's gross profit margin typically falls within the 20% to 30% range.

United States market for UV Absorber HEB is estimated to increase from US\$ million in
