In an effort to reduce carbon emissions, global efforts to develop paints and coatings with low VOC footprints are steadily increasing. UV-curable resins have emerged as attractive alternatives to thermoset resins, thanks to their low solvent requirement and high efficiency during drying, contributing to sustainable development goals. Functional polyesters are also used in aerospace, automotive and other industrial applications to support their versatility, mechanical properties, hardness and chemical and UV resistance. With increasing funding for transport aircraft manufacturing projects in developing countries, consumption of polyester acrylate UV-curable resins will surge to develop high-resistance coatings. With the rapid growth of construction investment, the demand for UV curable coatings will increase, thereby promoting the use of UV resin curing machines and contributing to a carbon-free society. Oligomer UV curable resins are gaining acceptance due to their high adhesion, cohesiveness, elasticity, elongation and sensitivity to environmental triggers. In addition to excellent weather and solvent resistance, the component can also exhibit self-healing properties. Hence, increasing investments in electric vehicle production facilities will boost the adoption of oligomers in UV-curable protective coatings, considering their durability, minimalist appearance, and low VOC emissions.
