The global UV LED Collimated Exposure Light Source System market size is predicted to grow from US$ 141 million in 2025 to US$ 246 million in 2032; it is expected to grow at a CAGR of 8.4% from 2026 to 2032.

A UV LED Collimated Exposure Light Source System is an ultraviolet exposure illumination system that uses UV LED arrays as the light source and converts the emitted light into a highly uniform and collimated beam through optical components such as collimating lenses, reflectors, light pipes, fly-eye lenses, homogenizers and filters. It is designed to provide stable exposure intensity, controlled exposure dose and a small divergence angle for photolithography, printed circuit board exposure, solder mask exposure, dry film exposure, touch panel manufacturing, display panel processing, MEMS fabrication and other photo-patterning applications. Compared with mercury lamp exposure sources, UV LED collimated systems generally offer longer lifetime, lower heat generation, faster switching, better wavelength selectivity, lower energy consumption and more precise digital control.

In 2025, global sales of UV LED Collimated Exposure Light Source System reached approximately 2,613 units, with an average global market price of around US$ 55 K/unit. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 30% to 50%.
