UV PSA (UV pressure-sensitive adhesive) is a special type of pressure-sensitive adhesive that cures when exposed to ultraviolet (UV) light. This adhesive does not require heat or mechanical pressure to achieve bonding, but rather activates the adhesive molecules through ultraviolet light, causing them to change from liquid to solid, thereby achieving bonding.

UV PSA is characterized by its fast curing ability, which can complete the bonding process in a very short time, suitable for automated production lines, and improve production efficiency. In addition, UV-curing adhesives generally have high bonding strength, good temperature and chemical resistance, and bonding ability to a variety of materials. They are particularly suitable for applications that are temperature sensitive or require stress-free bonding.

The global UV Pressure Sensitive Adhesive (PSA) market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
