Abstracts

The global UV Release Dicing Tape market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

UV release dicing tape, also known as UV tape or UV curable tape, is a specialized adhesive film used in semiconductor manufacturing processes, particularly for wafer dicing. It features a temporary bonding capability that allows semiconductor wafers to be securely held during dicing and other processing steps. The key characteristic of UV release dicing tape is its ability to be easily removed after processing by exposure to ultraviolet (UV) light, leaving minimal residue on the wafer surface. This property is crucial to ensure the cleanliness and integrity of the semiconductor devices fabricated on the wafers. UV release dicing tape is widely used in the semiconductor industry to facilitate the separation of individual semiconductor chips (die) after dicing, enabling high-precision manufacturing of integrated circuits (ICs) and other semiconductor devices.

UV Tape is adhesive tape for semiconductor process. It is suitable to protect surface of semiconductor wafer during backgrinding process, and to hold semiconductor wafer with ring frame during dicing process. It is also applicable for various workpieces such as ceramics, glass, sapphire and so on.
