Using ultraviolet (UV) printing technology, an insulating shell can be sprayed on the surface of lithium batteries. The purpose of this is to increase the safety and durability of lithium batteries. The insulating shell can prevent the battery from direct contact with the external environment and reduce the risk of possible short circuits. It can also protect the internal structure of the battery and improve the battery's anti-aging ability and service life. The UV printing process is usually able to cure quickly, improve production efficiency, and can achieve precise control during the spraying process to ensure that the outer casing is evenly covered on the battery surface.

The global UV Spray Printing market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
