UV Stabilizers are chemical compounds used to prevent a chemical process referred to improve polymers' resistance to degradation caused by the photo-oxidation process. As polymers consist of chains of repeating units, sunlight can break them down. Eventually, the plastic becomes brittle and crumbles apart due to the breakdown process. UV stabilizers work by absorbing or reflecting the UV rays, thus preventing them from reaching the material and causing damage. This can help to extend the life and maintain the integrity of the material, making it more durable and resistant to the effects of UV exposure.
