The global UWB High-Precision Positioning Chip market size is predicted to grow from US\$ 1076 million in 2025 to US\$ 3318 million in 2032; it is expected to grow at a CAGR of 16.6% from 2026 to 2032.

UWB Positioning Chip is an ultra-wideband wireless chip used for centimeter-level ranging, secure proximity detection, indoor positioning and radar-like sensing. It is used in smartphones, trackers, automotive digital keys, smart access systems and industrial real-time location systems. In 2025, global UWB Positioning Chip production reached approximately 240,000 K units.

UWB demand is supported by secure ranging functions that Bluetooth or Wi-Fi cannot easily replace. Automotive digital keys, item trackers and premium smartphones are the main volume drivers, while industrial location systems create higher-value but more project-based demand.

The technology is moving from simple ranging toward integrated security, angle measurement and sensing. This increases the role of software stacks, antenna design and certification, so chip vendors often compete through reference designs and ecosystem partnerships.

Adoption is still uneven because low-cost applications often choose Bluetooth, while UWB requires extra hardware and system calibration. However, once UWB is integrated into phones, vehicles and access-control infrastructure, network effects can improve the long-term growth outlook.
