V blender is one of the most sought after blenders or tumblers. V blenders are designed to perform a number of mixing and blending operations of powder materials. These operations include both gentle and extremely vigorous type blending and mixing. It comprises two inclined cylinders which are fixed together at an angle of 70° to 90° to create a conical shape. When the rotation takes place in the shell materials are crushed and mixed with the highest level of efficiency possible. Recurring converging and diverging motion of material and increased frictional contact between the material and the barrel's straight sides makes homogeneous mixing possible in the equipment. Through mechanical transmission, the powder materials in the shell are displaced back and forth, constantly being split and intermixed as the shell rotates to achieve ultimate uniformed mixing. Normal cycle times are typically in the range of 15 minutes; however, it can be less depending on the difficulty of blending. The V blender can be equipped with an intensifier bar, which helps in mixing and breaking up materials.

The global V Blender market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
