EEPROM (electrically erasable programmable read-only memory) is user-modifiable read-only memory (ROM) that can be erased and reprogrammed (written to) repeatedly through the application of higher than normal electrical voltage. Unlike EPROM chips, EEPROMs do not need to be removed from the computer to be modified. However, an EEPROM chip has to be erased and reprogrammed in its entirety, not selectively. It also has a limited life - that is, the number of times it can be reprogrammed is limited to tens or hundreds of thousands of times. In an EEPROM that is frequently reprogrammed while the computer is in use, the life of the EEPROM can be an important design consideration. The report focuses on Serial EEPROM ?1Mbit.

The global ?1Mbit Serial EEPROM market size is projected to grow from US\$ 772 million in 2024 to US\$ 1115 million in 2030; it is expected to grow at a CAGR of 6.3% from 2024 to 2030.
