V8 protease, also known as Glu-C protease or endoproteinase Glu-C, is a cysteine protease derived from the bacterium *Staphylococcus aureus*. It is characterized by its specificity for cleaving peptide bonds at the carboxyl terminal side of glutamic acid residues in proteins. This enzyme is highly valued in protein research for its ability to produce well-defined peptide fragments, which are essential for protein sequencing, mapping, and structural analysis. V8 protease is frequently used in conjunction with mass spectrometry techniques in proteomics to identify and characterize proteins.

The global V8 Protease market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
