The vacant hypromellose capsules are made from hypromellose and excipients. Hypromellose is 2-hydroxypropyl ether methyl cellulose with a relative molecular weight of 86000. It is derived from cotton linter or wood pulp fiber, which is treated with caustic soda and then etherized with propylene oxide, chlorane and alkali cellulose.

Hollow capsules, also known as gelatin capsules or empty capsules, are a common pharmaceutical and nutraceutical dosage form used to encapsulate various active ingredients, such as drugs, dietary supplements, and herbal extracts. The pharmaceutical industry is a major consumer of hollow capsules. The continued growth of the pharmaceutical sector, driven by factors like an aging population and the development of new drugs, has contributed to the demand for capsules. The nutraceutical and dietary supplement industries have witnessed significant growth, with consumers seeking wellness and preventive health solutions. Hollow capsules are used to encapsulate vitamins, minerals, herbal extracts, and other supplements. The growth of biopharmaceuticals, including biologics and biosimilars, has led to increased demand for specialized capsules designed for specific drug delivery requirements.
