The global Vacuum Ceramic Disc Filter market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

A vacuum ceramic filter is a device that uses porous ceramic as a filtering medium and vacuum suction to perform solid-liquid separation. It is widely used in industries such as mining, metallurgy, chemicals, and environmental protection. The machine works by drawing slurry onto ceramic filter plates, where liquid is drawn through the pores by vacuum, leaving solid particles on the surface as a filter cake. The filter cake is then removed by backwashing or scraping. Vacuum ceramic filters are known for being energy-efficient, producing clean filtrate, having low filter cake moisture content, and operating reliably, making them ideal for processing fine mineral particles and high-concentration slurries.
