Vacuum fuse means that the melt connects the two electrodes in the vacuum to conduct the current. In the event of overload or short-circuit fault, the melt melts and evaporates to form a vacuum arc. The voltage of the vacuum arc is very low, only about tens of volts. When the arc current crosses zero, due to the pressure difference in the vacuum, the residual metal vapor and particles in the arc gap quickly and strongly diffuse around, and the diffusion speed can reach 102-104m/s. Therefore, once the arc is extinguished, the arc will not reignite.
