The global Vacuum Induced Autoclave market size is predicted to grow from US\$ 1088 million in 2025 to US\$ 1669 million in 2032; it is expected to grow at a CAGR of 6.4% from 2026 to 2032.

A vacuum-induced autoclave, also known as a pre-vacuum or vacuum-assisted autoclave, is an advanced sterilization device that enhances the sterilization process by removing air from the chamber before steam is introduced. This is achieved through a series of vacuum pulses that evacuate the air, ensuring that steam can penetrate even the most complex and tightly packed instruments, which might not be effectively sterilized in a gravity autoclave. The vacuum-induced process allows for faster and more thorough sterilization, making it ideal for sterilizing items with lumens, porous materials, and densely packed loads. Widely used in medical, dental, and research settings, these autoclaves ensure higher sterilization standards, particularly for critical instruments that require rigorous decontamination.
