Vacuum Jacketed Pipe (VIP) system is a type of insulation technology that is used to maintain the temperature of refrigerated or cryogenic liquids as they flow through pipes. It consists of inner and outer pipes with a vacuum-insulated space between them. The inner pipe is typically constructed from materials suitable for cryogenic temperatures, such as stainless steel or aluminum, and it carries the cryogenic fluid. Surrounding the inner pipe is an outer pipe, creating a vacuum layer between the two pipes. This vacuum space is essential for minimizing heat transfer, as it significantly reduces conduction and convection heat losses, thus maintaining the temperature of the cryogenic fluid during transportation.

The global Vacuum Jacketed Pipe (VIP) System market size is projected to grow from US\$ 374 million in 2024 to US\$ 508 million in 2030; it is expected to grow at a CAGR of 5.2% from 2024 to 2030.
