A vacuum phosphor display is a display device similar to a cathode ray tube.

The main component of the vacuum phosphor tube is an electron tube with a grid. The electrons emitted by the cathode are attracted by the grid and accelerate toward the anode, and then hit the phosphor coated on the anode to emit visible light. The brightness of the vacuum phosphor tube can be changed by adjusting the voltage of the grid. A large number of vacuum phosphor tubes can be arranged to form a vacuum phosphor powder display. Each phosphor tube displays a pixel.
