Vacuum-sealed packaging is a method used to extend the shelf life of perishable goods by removing air from the packaging before sealing it. This process involves placing the product in a plastic film, extracting the air using a vacuum sealer, and then sealing the package tightly. By eliminating oxygen, vacuum-sealed packaging helps prevent the growth of aerobic bacteria and mold, slows down oxidation, and preserves the freshness, flavor, and nutritional value of the product. This type of packaging is commonly used for food items such as meats, cheeses, vegetables, and prepared meals, as well as non-food items like electronics and medical supplies. It is popular for both commercial and home use due to its effectiveness in maintaining product quality and reducing waste.
