The core principle of the vacuum spin coater is to use a rotating table to fix the substrate and rotate it at high speed, while the liquid coating material is dripped onto the center of the substrate through a nozzle. The centrifugal force generated by the rotation makes the coating material spread evenly from the center to the surroundings, forming a thin and uniform coating. The whole process is carried out in a vacuum environment, which can avoid the influence of impurities and oxides in the air on the coating quality.

The global Vacuum Spin Coating Machine market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
