Vacuum Wastewater Conveyance System is a system that uses the pressure difference between the vacuum generated in the pipeline and the atmosphere to mix wastewater and air for collection and transportation. It consists of three elements: 'vacuum valve unit', 'vacuum pipeline' and 'vacuum station' constitute. Sewage from household drainage flows in a gravity-flow manner and flows into the vacuum valve unit through the drainage equipment in the house. After a certain amount of sewage flows in, the vacuum valve will automatically start, and sewage and air will be sucked into the vacuum pipeline. The air sucked into the vacuum pipeline expands, and the sewage is converted into a gas-liquid mixed phase flow, which is collected and transported to the vacuum station.

Vacuum Wastewater Conveyance System is a hygienic and highly efficient system for environmentally friendly sewerage collection. Compared to conventional sewerage systems, the construction and installation of a Vacuum Wastewater Conveyance System is considerably simpler and more reasonably priced. The system operates within an enclosed and leak-proof vacuum network, so sewage cannot flow out and pollute surrounding areas. Vacuum Wastewater Conveyance System can be installed just below frost level, allowing shallow and narrow trenching and thereby minimizing construction time and environmental disturbance. The flexibility in the pipework installation makes it possible to overcome unforeseen obstacles by passing over, under, or around the obstacle, ensuring minimal delays and eliminating unnecessary expenses. The installation of a vacuum sewer system incurs significantly reduced labor and material costs compared to gravity sewers, primarily due to decreased labor and trenching expenses associated with the use of smaller diameter vacuum mains.

The global Vacuum Wastewater Conveyance Systems market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
