Vanadium dioxide is an oxide with the molecular formula of VO_2 and molecular weight of 82.94. It is dark blue crystal powder with monoclinic structure. It is insoluble in water and soluble in acid and alkali. When it is dissolved in acid, it cannot generate tetravalent ions, but generates positive bivalent vanadium oxide ions. When heated to red heat in the dry hydrogen gas stream, it is reduced to vanadium trioxide, or oxidized by air or nitric acid to produce vanadium pentoxide, which is dissolved in alkali to generate vanadate. It can be prepared by reducing vanadium pentoxide with carbon, carbon monoxide or oxalic acid.
