Vane type rotary actuators are mechanical devices used to convert fluid energy into rotary motion. They typically consist of a cylindrical housing with a vane (a flat, elongated piece) positioned inside. The vane is connected to a central shaft and is free to rotate within the housing.

When fluid (usually hydraulic or pneumatic) is introduced into the housing, it pushes against the vane, causing it to rotate. This rotation is then transferred to the central shaft, allowing the actuator to produce rotary motion. Vane type rotary actuators are commonly used in various industrial applications where precise and controlled rotational movement is required, such as in valve control, robotics, and machinery automation.

The global Vane Type Rotary Actuators market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
