A variable delivery pump is a type of hydraulic pump that is capable of adjusting its output flow rate according to the demand of the system it is supplying. This is achieved by varying the displacement of the pump, which determines the volume of fluid it can deliver per unit of time.

Variable delivery pumps are commonly used in hydraulic systems where the flow rate requirements can vary significantly. By adjusting the pump's displacement, the system can maintain the desired flow rate and pressure, even as the demand changes.

There are different types of variable delivery pumps, including variable displacement vane pumps, variable displacement piston pumps, and variable displacement gear

pumps. Each type has its own mechanism for adjusting the displacement, such as changing the angle of the vanes or adjusting the swash plate angle.
