The variable temperature hot air gun mainly uses the hot air blown from the gun core of the heating resistance wire to weld and remove the components. According to the working principle of the hot air gun, the main part of the control circuit of the hot air gun should include a temperature signal amplifying circuit, a comparison circuit, a thyristor control circuit, a sensor, a wind control circuit, etc. In addition, in order to improve the overall performance of the circuit, some auxiliary circuits should be set up, such as temperature display circuit, shutdown delay circuit and zero-crossing detection circuit. The temperature display circuit is set to facilitate temperature adjustment. The temperature displayed by the temperature display circuit is the actual temperature of the circuit, and workers can manually adjust it according to the temperature displayed on the display during operation.
