Vascular Interventional Balloon Dilatation Catheters are an interventional medical device product. They are mainly used in three aspects. One is used to dilate and dredge blood vessel stenosis. The balloon is briefly expanded at the diseased blood vessel and then quickly taken out. The balloon squeezes the plaque in the blood vessel to restore the forward blood flow in the blood vessel; the second is used to deliver stents and expansion stents. The stent is pre-installed on the surface of the balloon and delivered to the stenosis of the blood vessel. When the balloon is inflated When it is used, it will expand the stent, and then the balloon will be decompressed and withdrawn, and the stent will remain at the target blood vessel; thirdly, it plays the role of blocking the blood vessel to facilitate subsequent intravascular interventional treatments, such as in the field of neurointerventional The balloon guiding catheter (BGC) and the balloon microcatheter used in TACE treatment use a compliant balloon to temporarily block blood flow to facilitate subsequent operations.
