A vascular transilluminator is a medical device that uses a specific light source to transilluminate the skin and capture images of subcutaneous blood vessels. Its working principle is based on the absorption and reflection characteristics of blood vessels for specific light. By transilluminating the skin tissue, the blood vessels form a visible image on the skin surface. This technology has important clinical value for observing vascular structures, assessing blood circulation, and assisting in the diagnosis of vascular-related diseases.

The global Vascular Transilluminator market size is projected to grow from US\$ 151 million in 2024 to US\$ 212 million in 2030; it is expected to grow at a CAGR of 5.8% from 2024 to 2030.
