Vasoplegia is a type of syndrome that involves pathologically low systemic vascular resistance. It further leads to reduced blood pressure amid presence of a raised cardiac output. Vasopressin is an antidiuretic hormone directed to be used for the treatment and prevention of postoperative abdominal distention in abdominal roentgenography. It is mostly used as an intensive care medicine. Vasopressin infusion efficiently increases systemic vascular resistance and arterial pressure while improving survival chances in patients. Additionally, it decreases catecholamine vasopressors requirements in the patient with or at the risk of vasoplegic syndrome after cardiac surgery.
