Vehicle Painted Surface Inspection System is an advanced quality control solution used in automotive manufacturing to detect and evaluate surface defects on painted vehicle bodies and components. These systems employ technologies such as high-resolution cameras, structured light, reflective deflectometry, and artificial intelligence (AI) to identify defects like scratches, dents, orange peel, inclusions, paint sags, and contamination on clear coat and base coat layers. Depending on the configuration, inspection systems may be installed inline after the paint shop (post-paint inspection), within tunnel-like enclosures for full-body scans, or at manual workstations for spot-checking. Modern systems integrate with robotic arms or conveyor-based transport to provide real-time, non-contact inspection and automatic defect classification. In high-throughput production lines, these systems reduce reliance on human visual inspection, increase defect detection accuracy, and help ensure aesthetic consistency and compliance with OEM paint quality standards. They are widely used by automakers and suppliers to improve product quality, reduce rework costs, and maintain high levels of customer satisfaction.
