The global Vehicle-To-Grid (V2G) Module market size is predicted to grow from US\$ 2159 million in 2025 to US\$ 13930 million in 2032; it is expected to grow at a CAGR of 31.1% from 2026 to 2032.

A Vehicle-to-Grid (V2G) module is a technology that allows electric vehicles (EVs) to not only draw power from the electrical grid but also to send electricity back into the grid. This two-way flow of energy turns EVs into potentially valuable energy storage units that can help stabilize the grid, reduce peak demand, and even provide backup power during outages.

The market for Vehicle-to-Grid (V2G) modules is primarily driven by the growing adoption of electric vehicles (EVs) and the increasing need for grid stability and energy flexibility. As global efforts toward decarbonization intensify, V2G technology enables EVs to function as distributed energy resources, supporting grid services such as peak shaving, frequency regulation, and renewable energy integration. Government policies promoting smart grid infrastructure, financial incentives for bidirectional charging, and the emergence of pilot programs in the U.S., Europe, China, and Japan further accelerate demand. Additionally, advancements in V2G-compatible EVs and charging equipment, along with rising electricity costs, are prompting utilities and fleet operators to explore V2G as a cost-saving and grid-supporting solution.
