The research report highlights the growth potential of the global Vehicles Equipped with Air Suspension market. With recovery from influence of COVID-19 and the Russia-Ukraine War, Vehicles Equipped with Air Suspension are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Vehicles Equipped with Air Suspension. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Vehicles Equipped with Air Suspension market.

The main difference between the active air suspension and the passive suspension of the transmission lies in the elastic elements they use and the way to control the softness and hardness of the elastic elements. Active air suspension can control the amount of air spring inflation according to specific conditions, so as to control softness and firmness. The traditional passive suspension can only be submissive.

Active air suspension not only has unique charm in terms of comfort, but also in terms of safety, due to the intervention of electronic systems, the limit control ability of active

suspension is better than that of ordinary suspension: when cornering at high speed, the driving computer controls the outer wheels. The advanced air springs and shock absorbers are automatically stiffened to reduce the roll of the body; during emergency braking, the electronic module will also strengthen the stiffness of the front wheel springs and shock absorbers to reduce the inertia of the body forward.
