Vendor managed inventory software, also known as VMI software, is an inventory management software where a vendor creates orders for their customers based on demand information they receive from the customer. VMI systems support the practice of managing inventory stored at a customer's site. These solutions allow a supplier of goods (such as a manufacturer) to optimize the inventory held separately by the buyer (usually a distributor or retailer) by telling the supplier how much of each item to send to a customer's location.

The most important use of this type of solution is for replenishment purposes. VMI software utilizes stock status data such as on-hand inventory, daily sales, and goods in transit information that is provided directly from the customer. This data (usually received via EDI software documents) helps generate demand forecasts in order to create optimized vendor managed inventory orders.
